A WISE STAKE READER

The Receiving Side of Interest

First edition, November 2026.

This book was written in the early hours of a November morning, by people who could not sleep because of a question about money. It is offered free, because the first thing that needed to change was the price of finding out.

Free means share it. Send it to the person you thought about when you read Chapter Two.

Wise Stake Consulting LLC provides consulting and self-serve financial infrastructure. It is not a bank, insurer, broker-dealer, or investment adviser. This book explains an idea; it is not legal, tax, or investment advice. Yields are protocol distributions that vary and are never guaranteed. Digital-asset positions carry risk, including loss of value. Read Chapter Nine slowly.

What time is it?

Wise Stake Consulting LLC | wisestake.consulting

CHAPTER ONE

What time is it?

It is late at night, and you are asking a money question you have never quite said out loud.

Here is a secret worth starting with: the money in your bank account is not resting. The moment it arrives, it goes to work - just never for you. Your deposit becomes part of a pool, the pool becomes a loan, the loan becomes someone's mortgage or their car note or the tower downtown, and every dollar of interest it earns along the way lands in an account with someone else's name on it.

You were taught that this is simply what money does. You deposit. They invest. You get a savings rate that rounds to zero and a score that grades how well you behave with what's left. The whole machine runs on one quiet assumption: that the people who supply the money are not the people who should be paid for it.

This little book is about the end of that assumption. It is about a change that has already started - not a rebellion, an exit. The money is changing rooms. This is a guide to the room it is moving into, who gets paid there, and why, for the first time in a hundred years, the answer can be: you.

Say it plainly, then: you labored for that paycheck. It is direct-deposited into a bank, so they can put your money to work to make more money for them - instead of you. This book is about doing that for yourself, so that one day you no longer have to work. Not because you stopped laboring, but because your money finally labors alongside you.

“The cure for money that sleeps is money that works.”

CHAPTER TWO

The tower

Look at any skyline. In almost every major city, the tallest building belongs to a bank.

That tower was not built by the bank's owners. Not really. It was built floor by floor out of the deposits of millions of ordinary people - the nurse, the driver, the grandmother with her pension, the twenty-something saving for a car. Their money supplied the bricks. The interest those bricks earned supplied the mortar. And when the tower was done, here is what each of those people received: the right to keep depositing.

Nobody feels robbed, and that is the genius of it. The doorman is polite. The app is blue and pleasant. But walk to the entrance and read the sign nobody engraved, because it never had to be: owners only. The depositors funded every floor, and not one of them owns a closet in the building.

Meanwhile the interest rate paid on deposits - the price the tower pays for its raw material - is set the way any buyer sets a price when the sellers have nowhere else to go. Low. Very low. Historically, humming-along low. Even at this writing, when banks are paying their most competitive rates in decades, the good accounts pay around five percent. The tower's own lending floors charge many times that.

> **“The people supplied the bricks. The bank owns the tower.”**

What we propose is a different architecture. Here, the building is not on their street. It is in your stake. The rest of this book explains how.

CHAPTER THREE

The receiving side of interest

Every interest payment in the world has two sides. Most people live on the wrong one.

When you borrow - a car, a house, a balance on a card - you are on the paying side of interest. Month after month, interest flows out of your life and into someone else's portfolio. When you deposit, you are nominally on the receiving side - but the amounts tell the truth. A savings account at a large bank pays a rounding error. The same bank lends your deposit back to you at a premium. The difference, the spread, is not a bug in the system. The spread IS the system.

Now look at the other side of the ledger - the receiving side that has always been kept behind glass. Private credit. Asset financing. Staking engines. The machinery the wealthy access through brokers and connections has paid, in various seasons, anywhere from the high single digits to several times what savings accounts offer. Nothing about that machinery requires wealth. It requires access - and access is what changed.

Decentralized finance did not invent yield. It removed the velvet rope. A staking position - money pledged to a network that pays for the privilege of using it - can be opened by anyone with a phone. The rates are set by open markets instead of a pricing committee, and they have run far above anything a bank savings account pays. They also vary, and they are never guaranteed; we will be honest about that in Chapter Eight. But the direction of the flow is the revolution: interest that used to visit the depositors now lives with them.

Wise Stake exists to move you from the paying side of interest to the receiving side - permanently, and by name.

> **“Stop being on the opposite side of interest. Provide something that pays it.”**

CHAPTER FOUR

Collateral is the new credit

A credit score measures whether you can be trusted with what is already yours.

Consider how strange that is. A score built from your history of borrowing decides how much of your own money the bank will let you access, and at what price. Miss a payment during the worst year of your life, and the price of your own money goes up.

The wealthy solved this long ago, and they did it by refusing to play. They borrow against what they hold - securities-backed lines, pledged portfolios, cash-value policies. The collateral is the credit. No application theater, no score, because there is nothing to score: the lender holds an asset that already pays. Banks adore these loans. They just do not advertise them to people who work for a living.

The strange part is that the boring version already exists at your local credit union. It is called a share-secured loan: pledge your savings, borrow against it at a point or two above the deposit rate, no credit check needed, because the collateral is the payment stream. It was never popular for one reason - savings paid so little that pledging them was pointless.

That reason just expired. When the thing you hold pays meaningfully, pledging it is no longer a sacrifice - it is a strategy. The borrower keeps the position. The position keeps paying. The lender gets paid from the machine instead of squeezing the borrower. Everyone eats, and nobody's hospital bill from 2019 decides the interest rate.

> **“Credit scores graded people. Collateral grades holdings.”**

CHAPTER FIVE

The melting ice cube

Imagine working your whole life for a currency that can be printed without limit. You do not have to imagine it.

Here is the strangest fact of modern money, said as plainly as it can be said: the money you earn, save, and plan your retirement around can be created in unlimited amounts, by a small group of people, without asking you. When more of a thing can appear at any moment, each existing piece of it owns a smaller share of the future. That is why your grandparents' movie ticket cost a fraction of yours. The movie did not change. The dollar did.

Watch it happen with a pizza. One pizza, cut into eight slices, feeds a family. Now suppose someone cuts the same pizza into sixteen slices and calls it twice the food. Nothing new exists - but every slice is half as big, and everyone pretending otherwise is hungry by dinner. Printing money is cutting the pizza. Your paycheck is a slice. The printing does not shrink your paycheck - it shrinks what the paycheck is.

Fixed supply versus infinite supply - which is worth more? An infinite supply is a bucket with a slow hole in the bottom; you can pour forever, and it never fills. A fixed supply is a sealed jar: nobody can cut more slices into it, ever, no matter how many people want in. When more people want what the jar holds, the only price that can move is up. Scarcity is not a technical detail. It is the entire game. The dollar is the bucket - over 23 trillion of them exist and more arrive every year, and each new arrival quietly dilutes yours. A fixed-supply asset, by contrast, cannot be diluted by a vote, a committee, or an emergency. Nobody is above the jar.

Now ask the question nobody asks at the retirement seminar: why are you building your retirement on the bucket? You work four decades for a melting currency, park it in accounts denominated in that same currency, and hope the melting is slow enough to outpace. Meanwhile the tower from Chapter Two holds the melting currency, prints more of it, and lends it back to you at interest. Inflation is not weather. It is not something that happens TO the system. It is a transfer - from everyone who holds the bucket to everyone who prints it and lends it. You have been on the wrong end of that transfer your entire working life.

WISE was launched with a fixed supply, written in code rather than promised in a prospectus - and a position in it earns while it holds, instead of melting while it waits. That is the trade this book is about: stop saving in the thing that leaks, and start holding the thing that cannot be printed. A fixed-supply asset will still have its up and down days - Chapter Nine is where we say that honestly. But there is only one of these two assets that can be made worthless by a meeting.

> **“The dollar is a bucket with a hole. Your stake is a sealed jar. Only one of them can be printed.”**

CHAPTER SIX

The ladder

Every month you pay bills. Every month the payments vanish. What if they didn't?

Add up what you have paid in interest across your life: car notes, cards, the mortgage you refinanced in a panic. Now imagine that money had, instead, built something - one small earning position at a time, each one kept, each one paying you forever after. That is the ladder.

The mechanism is simple enough to explain at a kitchen table. Each month, in place of - or alongside - a bill, a new stake is created. The old world calls this a payment and erases it. The new world calls it the first step on a ladder - and stands on it. Twelve months in, the old world holds a folder of receipts for money that is gone. The ladder holds twelve positions that are not gone at all: they are working, accruing, and waiting.

We call the process deprogramming, because that is exactly what it is. Decades of financial advice trained people to measure discipline by how much they hand over and receive nothing back. The ladder reverses the muscle memory. The bill becomes the asset. The liability column of your life becomes, line by line, an asset column. Nobody has to be rich to start - that is the point. The ladder is how the person funding everyone else's tower finally funds their own.

> **“Every payment becomes a position. Every bill becomes the first step on a ladder.”**

CHAPTER SEVEN

What we actually build

Plain language, no jargon. This is the machinery, in one chapter.

A position is money you place with an open network that pays for the use of it - like a fixed-term certificate, except the network is public code rather than a bank's balance sheet. A position earns yield every single day. Yield is not magic; it is the network's fee for the capital it borrows from you. And just like a bank certificate, the money you placed - the principal - is never spent. Only its earnings move.

A scrape is the act of collecting the yield that has built up. We scrape on a schedule, not reflexively - collecting earned yield days before it is needed, so the network fees stay trivial and the discipline stays visible. What is scraped can be sent anywhere: to you, to a fund for a purpose, or split several ways at once.

A bundle is what we call the wrapped, named, purposeful version of a position. It has a label - a permanent name recorded on a public ledger, such as the family's name or the cause it funds. It has beneficiaries: up to six destinations, in shares the creator chooses. And it has a receipt - a transferable record of who owns the position, which is how inheritance, partnership, and pledged collateral all work without paperwork marathons.

That is the whole machine. Fund once. Yield accrues daily. Scrapes happen on schedule. Splits route the flow. The principal returns at the end of the term. Everything else in this book - every card, every use, every partner - is this one machine pointed at a different wall of life.

The owl who watches the machine. Every bundle carries a seal; every seal carries the same promise: the principal is never spent.

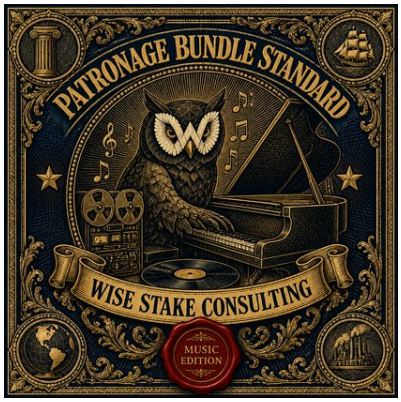

CHAPTER EIGHT

Twelve doors

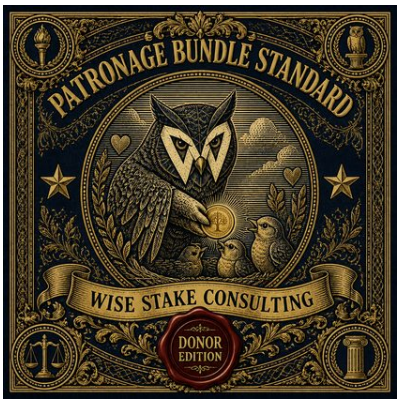

A bundle is named for the work it does. We issue twelve categories - each with its own engraved plate, its own seal, and its own job. Here is the gallery, one line per door. Any of them can hold your name.

SECURITY
A bug bounty that refills itself.

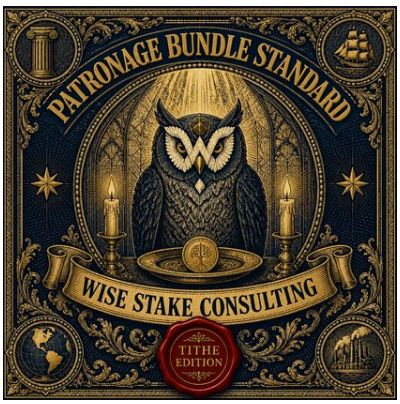

MUSIC
Songs that pay the artist without selling the master.

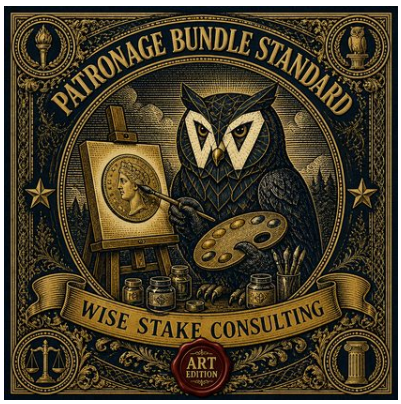

DONOR
Giving that outlives the check - and returns the gift.

LOYALTY
Members who hold a stake instead of paying a fee.

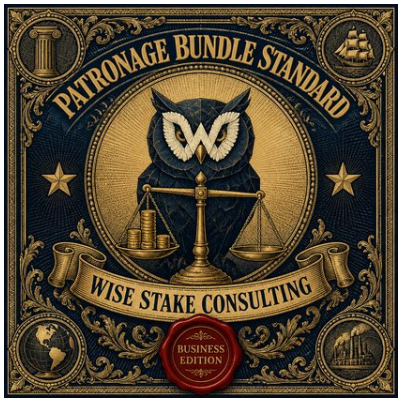

TITHE
A tithe that funds itself, set once.

ART
Art that keeps paying the artist after it sells.

MERCHANT
The shop's costs, paid by the shop's position.

BUSINESS
Operations funded by earnings, not invoices.

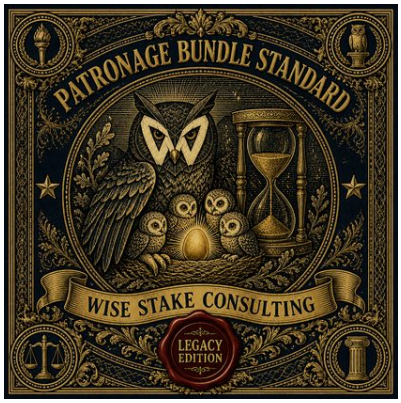

ENS
A name that pays its own renewal.

FAMILY
One deposit, yield split to the people you love.

PODCAST
Shows funded by position, not by ads.

LEGACY
An inheritance that lands in days, not years.

And one door is being cut for the workshop: TAX - a tax bill that funds itself, scraped quarterly on the government's own calendar. Ask and we will show you the plate.

Think about how taxes actually arrive. You work all week, you get your paycheck - and it has already been eaten. Like being served a plate of food for all your hard work, except somebody took a bite out of your chicken wings before the plate ever reached your table, and left the mess for you to deal with. Nobody asked. Nobody sends the bite back in April.

We do not fight the rules of the game - we change which side of the table you eat on. A TAX bundle pays its bill willfully: the money sits in your own pot all year, scraped from your own machine, landed before the deadline on your calendar instead of taken from your plate on theirs. Tax should be paid willfully. Not taken by force. The difference between those two sentences is the difference between a plate you serve yourself and a bite somebody else already took.

CHAPTER NINE

The honest fine print

If a pitch has no fine print, the fine print is hidden somewhere worse.

Fees. Our service fee is 1% of each scrape - taken from the yield at the top, before beneficiary splits. It is capped by contract at 5% and it never touches principal. Positions you create and manage yourself, self-serve through the website, pay no setup cost at all - only small network fees. White-glove setup, where we build everything with you and for you, is quoted per engagement before any work begins.

Yields. Protocol yields vary. They have historically run well above bank savings rates, and they can fall. Nothing in this book is a promise of any particular return, and anyone who guarantees you one is lying to you. We size every fund with a cushion and review it on a schedule.

Risk. Digital-asset positions carry market risk and smart-contract risk. Our bundle contracts are fork-tested - built on the pattern of contracts that have run in production - but they are not yet professionally audited, and we say so plainly. Start small. Size nothing you cannot think about calmly at 2am.

What we are not. We are not a bank, an insurer, a broker-dealer, or an investment adviser, and we do not hold your money - positions are held by you, at your own address, with your own keys. This book is education, not advice. For decisions with consequences, use qualified professionals - and note that Chapter Nine is addressed to exactly those professionals, because we would rather be their tool than their replacement.

> **“Start small. Read everything. Trust, but verify on-chain.”**

CHAPTER TEN

For the professionals

A note for the people who already serve them: agents, preparers, and lenders.

Insurance professionals. Your clients already trust you with their family's future. A LEGACY bundle sits beside an existing policy as the asset leg of the plan - a position that accumulates for the family and transfers to heirs in days, not years, with no probate queue for the transfer itself. You do not need to become a technology company; the bundle can name your agency as patron of record, and the machine can route your share of the relationship automatically.

Tax professionals. Your 1099 clients have a cash-flow problem you manage every quarter. A TAX bundle accrues all year and is scraped four times - days before each deadline - so the estimated payment is always already funded, sized near 110% of the client's effective rate. Your own fee can ride the same rail. Four guaranteed touchpoints a year, per client, with a live number on the table.

Lenders and credit unions. You already make share-secured loans; the only thing boring about them was the collateral. Positions that pay real yield change the math: pledge-secured notes, purchase-with-buyback structures, collateral instead of score. The engine pays; you do not have to.

In every case the pitch is the same: your clients are going to hold earning positions whether or not you are in the room. The only question is whether their professional helped them do it well. We would like to build that room with you.

> **“Be the bridge, not the blockade. The people hold the funds either way.”**

It's time.

Somewhere downtown, a tower just got one floor taller. The people who funded it walked past it without looking up, the way they always have.

You, however, just read a book about the door. The wall of plates is live, the machine runs on schedule, and the ladder is waiting for its first step.

Come see the wall.
